## Show Your Work!

 Good Luck!October 15, 2018 Quiz \#3 A

Name $\qquad$ (please print)

1. Quickies - just write the answer. A, B and C are constants. (1 point each)
(a) $D(\sin (5-3 x))=$ $\qquad$
(b) $D\left(\ln \left(x^{3}+2\right)\right)=$ $\qquad$
(c) $D\left(\sec \left(x^{2}\right)\right)=$ $\qquad$ (d) $D\left(\sqrt{7+x^{4}}\right)=$ $\qquad$
2. Calculate the following derivatives. Circle each answer. (Do NOT simplify your answers.)
(3 points each)
(a) $D\left(\left(x^{2}+\cos (x)\right)^{3}\right)=$
(b) $\frac{d}{d x}\left(e^{3 x} \cdot \ln (7 x)\right)=$
(c) $\frac{d}{d t}\left(\sin \left(\frac{2}{x}\right)+\tan (A x)\right)=$
(d) $\frac{d}{d t}\left(\ln \left(x^{3}+\sin (5 x)\right)\right)=$
3. $\mathrm{f}(1)=3$ and $\mathrm{f}^{\prime}(1)=2$. Then at $\mathrm{x}=1 \quad D\left(f^{3}(x)\right)=$ $\qquad$ and $D\left(f\left(x^{3}\right)\right)=$ $\qquad$
(4)
4. $\mathrm{T}(\mathrm{x})$ is the temperature $\left({ }^{o} F\right)$ at a depth of x meters. Explain in a clear complete sentence the meaning of ${ }^{66} \mathbf{T}{ }^{6}(\mathbf{2 0 0 0})=\mathbf{0 . 0 3}{ }^{6}$ so someone who did not know calculus could understand.
(2)
