Good Luck!

Nov. 6, 2018

Quiz #5 A

Name \_\_\_\_\_

(please print)

1. Use Logarithmic Differentiation to calculate  $dy/dx$  for  $y = \frac{(3x-2)^4(5x+7)^3}{(2x+8)^6}$ . (circle your answer)

$$\frac{dy}{dx} =$$

(6)

2.  $f'(x) = (x-4)^2(x-6)$  for  $1 \leq x \leq 7$ .

- (4) (a) What are the **Critical Numbers** of  $f$  on this interval?  $x =$  \_\_\_\_\_  
 (1) (b) At  $x = 3$  the function  $f$  is Increasing Decreasing Not enough information (circle one)

3. True or False (Write the entire word)

- (1) (a) \_\_\_\_\_ If  $f$  is differentiable on the interval  $[1, 7]$  and  $f'(3)=0$  then  $f(3)$  is a local max or min.  
 (1) (b) \_\_\_\_\_ If  $g(2)$  is a global minimum of  $g$  then  $g'(2) = 0$ .

4. If  $f(x)$  is a cubic polynomial (degree=3) on the interval  $0 \leq x \leq 8$

- (2) then  $f$  has at most \_\_\_\_ critical numbers on  $[0, 8]$ .

5.  $f(x) = x^2 - 4x + 5$  on the interval  $1 \leq x \leq 4$ . Then according to the Mean Value Theorem

- (2) (2) there is a value  $c$  so that  $f'(c) =$  \_\_\_\_\_. For this function and interval  $c =$  \_\_\_\_\_.

6. The graph of  $y = f(x)$  is shown for  $1 \leq x \leq 6$ . Plot and label the location(s) of the  $c$  value(s) from the Mean Value Theorem.

(2)
